

E2 Success Story #230: Product Development

About Morris Technologies:

Quality, innovation, and value are three things that have stuck with Morris Technologies since it's founding in 1994. Morris Technologies offers a wide range of product development services. Some of these include engineering and design, rapid prototyping, advanced CNC machining, rapid tooling, injection molding, and urethane reproduction. MTI is committed to having the most talented professionals working with state-of-the-art equipment. It is their goal to become the most innovative, comprehensive, collaborative, and respected product development company in North America.

Why did Morris Technologies Choose E2?

Before E2, MTI was working with a variety of software programs to try and manage the company. It became very hectic to use several, different programs to run daily activities such as accounting, quoting, job travelers, and other reports. "E2 allowed us to integrate all of these various packages into one common system and even more importantly, it allowed us to start using features such as time tracking and job cost summaries to better manage our business. E2 seemed to have all the features we were looking for coupled with easy-to-navigate screens that were very intuitive," Greg Morris owner of Morris Technologies added.

"MTI has been very pleased with the E2 system and look forward to continuing to explore other ways in which E2 will bring better efficiencies and bottom line results to our company."

Morris Technologies

The Results ... So Far:

During the transition stages with the software, MTI did not lose any data and did not experience any work disruptions. MTI began using the basic functions of E2, but soon moved on to explore the time tracking features of the system. "The time tracking features has helped automate the process of tracking time and materials projects so that they are extremely efficient in tracking the hours spent and the work performed," says Morris. "Our routers have also become more sophisticated and have allowed for more detailed tracking of time and costs at each work center when previously we were not able to track things as well," added Morris. The future for E2 and MTI is very bright. "MTI has been very pleased with the E2 system and look forward to continuing to explore other ways in which E2 will bring better efficiencies and bottom line results to our company."
